Differences between O365 native admin center and GSX Usage

Native Admin center

Data is retained just for 180 days

The capability to obtain trend reports is challenging

Lack of granular reports

Impossible to have any kind of filters and hence specific information is not available

No access control

Only system admins have access to this portal and view, business units do not have any access

No capability to export or schedule

This would need manual scripting taking hours and without this, it is not possible to share with it with management

Limited reports

Limited No. of reports, Provides very few reports just around 33 which is not sufficient

Zero customization capabilities

GSX 365 usage

Data is retained for more than an year

Obtain great adoption and trend analysis capabilities during migration and post migration

Obtain specific granular reports, thanks to filters

Create specific reports based on region/country, department etc., very useful for auditing

Great access control capabilities

Have the ability to create multiple profiles and allow business units such as procurement etc., have specific views

One click export and schedule mechanism

Just in a click, it is possible to schedule the report to any internal and external emails for auditing purpose

Vast No. of reports

90+ reports on mail traffic, security, mobile devices, exchange, skype for business, one drive, license report and SharePoint

Great customization capabilities

Easy customization, just in few clicks

Manage your Office 365 Licenses
